Function:
the foot bone is connected to
the head bone! Functional
Exercises & Treatment (Part 2)

Functional Exercise & Treatment

Anita Davidson PT, DPT, CAFS

Learning Objectives

- Explain functional concepts of eccentric vs concentric evaluation and treatment
- Demonstrate at least 5 new exercises for function off the plinthe
- Explain the modifications for traditional exercises to improve functional impact foot through the pelvis

4

Functional Treatment Follows Functional Testing...

Goal is restoring the
functional chain foot to
head

5

*If we only treat locally,
we risk not restoring
the functional chain
potentially setting the
patient up for future
injury*

6

Rule of thumb:

Educate patient in 3 planes

Mobilize joints in 3 planes

Release tissues in 3 planes

Increase ROM in 3 planes

Stabilize in 3 planes

7

Patient education related to 3 planes of motion is critical to connect why you would want to treat the feet to help the hip

Go back to the functional chain reaction of gait to support the why of what you prescribe

8

Evidence:

Lee et al identified that tibial rotation has a strong correlation with patellofemoral disorders. They noted that the degree of knee flexion has an inverse correlation with patellar position and tibial rotation, i.e. the greater the knee flexion, the more seated the patella is into the trochlear groove and less movement occurs of the patella.

Lee TQ, Yang BY, Sandusky MD, McMahon PJ 2001

9

*Foot Mobilization Allows
for Relative Balance
Between Pronation &
Supination*

11

12

Mid foot mobility allows for initiation of transverse plane motion & shock absorption from heel strike to push off during

13

14

If the functional chain starts with heel strike, if the foot is rigid the chain is stopped at impact

15

Soft Tissue mobilization follows joint mobilization to allow motion

16

Manual mobilization with movement improves the carryover into function

Functional Tri-Plane Exercises

Where do I start?

Stay Successful!

19

20

Muscles work in the
middle 50% of their
length...

*Need increased muscle
length to strengthen through
the range of motion*

21

Flexibility
*Stretch in 3
Planes of Motion*

22

*Treatment concepts for
the core and foot fit in
easily with our other
treatment techniques
and skills*

23

Psoas Stretches

Standing

- Reach up
- Back foot straight
- Lunge forward from hips
- Rotate away from back leg to finish the stretch
- Avoid letting the patient lead with trunk flexion or lose stretch

24

Psoas Stretches

Standing foot on chair

- Reach up
- Back foot straight
- Lunge forward from hips
- Rotate away from back leg to finish the stretch
- Avoid letting the patient lead with trunk flexion or lose stretch

25

Psoas Stretches

Kneeling

- One foot flat/on 1 knee
- Keep trunk upright
- Lunge forward from hips
- Rotate away from back leg to finish the stretch
- Avoid letting the patient lead with trunk flexion or lose stretch

26

Psoas Stretches

Back extensions

- Stand with hands at the low back
- Keeping your feet straight
- Bend back from the hips

Psoas Stretches

Staggered stance with other exercises

- Add one foot in front of the other with other exercises to limit psoas compensation

Hamstring Stretch

Take the usual stretches and add rotation!

Reach across your leg
and/or

Rotate stretch leg in/out

Hold the stretch during the added rotation

30

*Sitting
Reach
across
the leg or
roll it
in/out
Hip Hinge*

31

*Standing
reach
across
during
stretch
with leg
extended
Hip Hinge*

*Standing
reach
across
during
stretch
with leg
extended
Hip Hinge*

Supine

*Roll the straight leg into
internal/external rotation*

34

Pec Stretch

In door with
staggered stance
for psoas stretch

The same leg is
back as the arm
that is up

Latissimus Stretch

Combines Pectorals,
Latissimus, & Quadratus

*Functional exercises
can provide
simultaneous flexibility
and strengthening
benefits*

37

*Train the muscles in 3
planes of motion...
If one plane is painful...
work in pain free planes*

38

*So how do you get
rotation into your
muscle training?*

*Our bodies want relative
motion between extremes!*

39

Clock Steps & Reaches

3 Planes of Motion

Frontal

Sagittal

Transverse

40

Clock Steps & Reaches

3 Planes of Motion

8 Foot Directions

Right Toe In, Toe Out

Toe Straight, Alternating

Left Toe In, Toe Out,

Toe Straight, Alternating

41

Clock Steps & Reaches

3 Planes of Motion

8 Foot Directions

8 Arm Directions

Bilateral, Single Arm,
Alternating Arms,
Alternating Planes

43

Clock Steps & Reaches

3 Planes of Motion

8 Foot Directions

8 Arm Directions

Static vs Dynamic

Static Feet, Static Arms

Dynamic Feet, Dynamic
Arms

46

Clock Steps & Reaches

3 Planes of Motion

8 Foot Directions

8 Arm Directions

Static vs Dynamic

High vs Low Reaches

Reach up works the abs

Reach low works the gluts

48

*Reaching
overhead loads
the abdominals
increasing
strength and
eccentric
loading*

*Reaching below waist
level loads the gluteals
increasing strength and
eccentric loading*

50

Evidence:

*Remember Dierks et al
correlation between weak
Hip ER & patellofemoral
pain...*

*How to load the gluteals to
strengthen gluts in 3 planes?*

52

Clock Steps & Reaches

3 Planes of Motion

8 Foot Directions

8 Arm Directions

Static vs Dynamic

High vs Low Reaches

Progress from static to dynamic
for agility training

54

GlutFamily: Maximus, Medius, Minimus
Degrees of External Rotation...
to get more Max, add more rotation!

Sit Back Reach

We want a hip
hinge to
eccentrically load
the gluteals
Play with rotation
degrees with
reaching
Straight=sagittal
Across=transverse

57

Sit Back Reach

Look for
compensations in
form that will
decrease the
gluteal loading

Locked lordosis
increases psoas
and avoids gluts

58

Sit Back Reach

Have patient reach down and watch their hands to soften the back and avoid psoas locking

Reach down and across to increase glut loading

59

Sit Back Reach

Cue to keep the toes point straight ahead especially if the patient is a chronic hip external rotator

Toe out puts the gluteals on slack with less eccentric

60

Sit Back Reach

The knee over the heel keeps the work load to the gluteals

If the knee floats forward, the work load shifts to the quad for every degree of forward motion

61

Keep the knee over the heel!

If the knee floats forward over the foot, the line of force moves through the knee joint causing a shearing force and strain on the patellar tendon.

Sit Back Reach

Cue to keep the toes point straight ahead especially if the patient is a chronic hip external rotator

Toe out puts the gluteals on slack with less eccentric

63

If the knee floats over the foot, the work load shifts to the quad and hamstring and lets the glut off the hook.

Patient may have medial/patellar tendon pain and not strengthen the butt!

If you want to focus on one leg for deficit can do single leg sit back either by propping the other toe for balance and sit back reaching low and across with the opposite arm

Can challenge with different surfaces...

67

...for higher level patient function

68

Can mix step reaches in different planes with sit backs

Take an exercise you know and add another plane of movement

*Add hip
abduction
adduction
with static
bridge to
increase hip
rotators,
pelvic floor,
foot mobility*

71

*Add hip
rotation with a
static bridge
to increase
abdominal
activation,
hip rotators,
foot mobility*

72

Be aware of hip position for psoas compensation

Evidence:

Boren et al evaluated 24 healthy subjects with surface EMG performing 18 exercises that are commonly used for gluteus maximus and medius strengthening. Highest maximal voluntary muscle contraction values achieved from 70-100% for gluteus medius included side plank/abduction (dominant leg top & bottom), single limb squat, clamshell, and front plank with hip extension. Gluteus maximus activation was greatest with front plank with hip extension, glut set, side plank with abduction (dominant leg top & bottom). This study assists with ranking gluteal strengthening exercises in rehab.

Boren K, Conrey C, LeCoguic J, Paprocki L, Voight M, Robinson TK, JOSPT 2011

78

Evidence:

Highest maximal voluntary muscle contraction values achieved from 70-100% for gluteus medius included side plank/abduction (dominant leg top & bottom), single limb squat, clamshell, and front plank with hip extension. Gluteus maximus activation was greatest with front plank with hip extension, glut set, side plank with abduction (dominant leg top & bottom). This study assists with ranking gluteal strengthening exercises in rehab.

Boren K, Conrey C, LeCoguic J, Paprocki L, Voight M, Robinson TK, JOSPT 2011

79

... When you identify
asymmetry in
strength/flexibility

... train asymmetrically until
the weak/tight side is equal

Then balance the activities

80

Common History:

*Current right shoulder
impingement*

4 yrs ago—plantar fasciitis left foot

*10 yrs ago—onset of intermittent
LBP*

Weight gain of 20# over past year

81

Common History:

Plantar fasciitis left foot:

- *Psoas restriction on the right hip
limiting swing phase on the right
with a hard impact?*
- *Poor mid-foot control on the left
foot?*
- *Poor hip eccentric control on the
left?*

82

Common History:

Intermittent Low Back Pain:

- *Psoas hypertonicity on one or both sides to stabilize the trunk/pelvis?*
- *Gluteal weakness in eccentric function resulting in harder impact with gait?*
- *Loss of transverse plane motion at the trunk/hips to the feet reducing eccentric control?*

83

Common History:

Weight Gain of 20#:

- *Psoas hypertonicity for trunk stabilization*
- *Decreased trunk rotation?*
- *Increased static hip ER for stabilization turning off the gluteals?*

84

Common History:

Current Right Shoulder Impingement:

- *Psoas restriction on the right hip restricting trunk rotation and limiting swing phase on the right with a hard impact?*
- *Poor mid-foot control on the left foot?*
- *Poor hip eccentric control on the left?*

85

Diagnosis: Plantar fasciitis

Cause: Rigid mid foot limiting shock absorption through the foot paired with weakness at the hip not controlling eccentric rotational motion and tight psoas on the contralateral leg

Assessment clues:

Lack to relative change with reaches

Weakness with floor reaches

Quad dominance with sit backs

86

Diagnosis: Plantar fasciitis

Treatment:

Foot mobilizations to allow for transverse plane

Psoas stretches to decrease heel impact in gait/increase gluts

Eccentric hip to foot training to support relative pronation and/or supination

Sit backs, Floor reaches

87

Diagnosis: Medial Knee Pain

Cause: Rigid mid foot limiting shock absorption through the foot paired with weakness at the hip not controlling eccentric rotational motion and tight psoas on the contralateral leg

Assessment clues:

Lack to relative change with reaches

Weakness with floor reaches

Quad dominance with sit backs

88

Diagnosis: Medial Knee Pain

Treatment:

Foot mobilizations to allow for transverse plane

Psoas stretches to decrease heel impact in gait/increase gluts

Eccentric hip to foot training to support relative pronation and/or supination

Sit backs, Floor reaches

89

Diagnosis: Patellofemoral Pain

Cause: Rigid mid foot limiting shock absorption through the foot paired with weakness at the hip not controlling eccentric rotational motion and tight psoas on the contralateral leg

Assessment clues:

- Lack to relative change with reaches
- Weakness with floor reaches
- Quad dominance with sit backs

90

Diagnosis: Patellofemoral Pain

Treatment:

Foot mobilizations to allow for transverse plane

Psoas stretches to decrease heel impact in gait/increase gluts

Eccentric hip to foot training to support relative pronation and/or supination

Sit backs, Floor reaches

91

Diagnosis: Low Back Pain

Cause: Tight psoas reducing hip/pelvis and lumbar transverse plane motion with weakness in the gluteals for eccentric/concentric stabilization.

Lack of mid foot motion may also assist in vertical compressive forces from the foot through the spine

92

Diagnosis: Low Back Pain

Assessment clues:

- Hard impact with heel strike in gait indicating tight psoas
- Hip ER with posture and gait resulting in slack gluteals
- Poor relative change with reaches
- Poor eccentric control for floor reaches and sit back tests with locked lordosis
- Correlation of psoas/hamstring with SLR

93

Diagnosis: Low Back Pain

Treatment:

Foot mobilizations to allow for transverse plane

Psoas stretches to decrease heel impact in gait/increase gluts

Eccentric hip to foot training to support relative pronation and/or supination

Sit backs, Floor reaches

94

Math Question

How long would it take a patient to strengthen/stretch the muscles of the hip/knee/calf traditionally compared to a total body approach to function?

*3 sets of 10 for strength
3 reps for 20 seconds stretches*

95

Math Question

Traditional Sagittal

Calf stretch
Hamstring stretch
Quad stretch

SLR
Quad Set
Hamstring curls
Toe rises
Hip extension

Triplane/Combination

Psoas/calf stretch
Hamstring stretch

Single leg balance
reach low
Sit back reaches

Which is more efficient?

96

Summary

97

Assess in 3 Planes of Motion

Treat in 3 Planes of Motion

Educate in 3 Planes of
Motion

99

*How do you
load the core
muscles?*

*Lengthen
under a load!*

101

Problem:

psoas
stabilizes in
the
absence of
the core &
gluteals

102

| | | |
|---|---|--|
| | <p>Glut max shuts down & loses its primary function during gait</p> | |
| <p>Psoas acts as load blocker</p> | |  |
|  | | <p>103</p> |

| | |
|---|--|
|  | <p>Solution:</p> <p><i>Restore the Chain Reaction!</i></p> |
| | <p>104</p> |

Restore the chain by lengthening the psoas and strengthening the gluts/abs!

Add a psoas stretch to RTC exercises to inhibit & retrain psoas while activating the core stabilizers

*There are
a lot of
ways to
get to the
same
outcome...*

*Using all 3
planes can
be faster*

109

My truths in clinical care:

Pain is not a requirement of life

Our patients tell us what's wrong

All roads lead back to the psoas

The foot bone *is* connected to
the head bone!
